

Lab 2 – Jira Hands-on: Agile Backlog Creation & Sprint Simulation

Project: Remote Patient Vitals Monitoring

SRN: PES1UG24CS320

Tool: Jira

Sprints Completed: 2

1. Did the estimations reflect the actual effort?

The story-point estimates provided a reasonable representation of the relative effort and complexity of the user stories. Smaller tasks, such as acknowledging a critical alert, were assigned fewer points, while more complex functionality, such as buffering and resynchronizing vital data, received a higher estimate. The estimates helped us divide the work across the two sprints.

2. Was the backlog well-prioritized?

Yes. The backlog was prioritized according to the importance of the functionality to the patient-monitoring workflow. Critical detection, notification, and escalation were given the highest priority because they directly support rapid response to critical patient conditions. Supporting features were prioritized after these core safety-related functions.

3. How did the simulated sprint align with the plan?

The work was divided across two sprints. Sprint 1 focused on the core patient monitoring and critical alert workflow, while Sprint 2 covered live dashboard functionality, alert acknowledgement, and reliable data synchronization. The stories were moved through To Do, In Progress, and Done to simulate sprint execution.

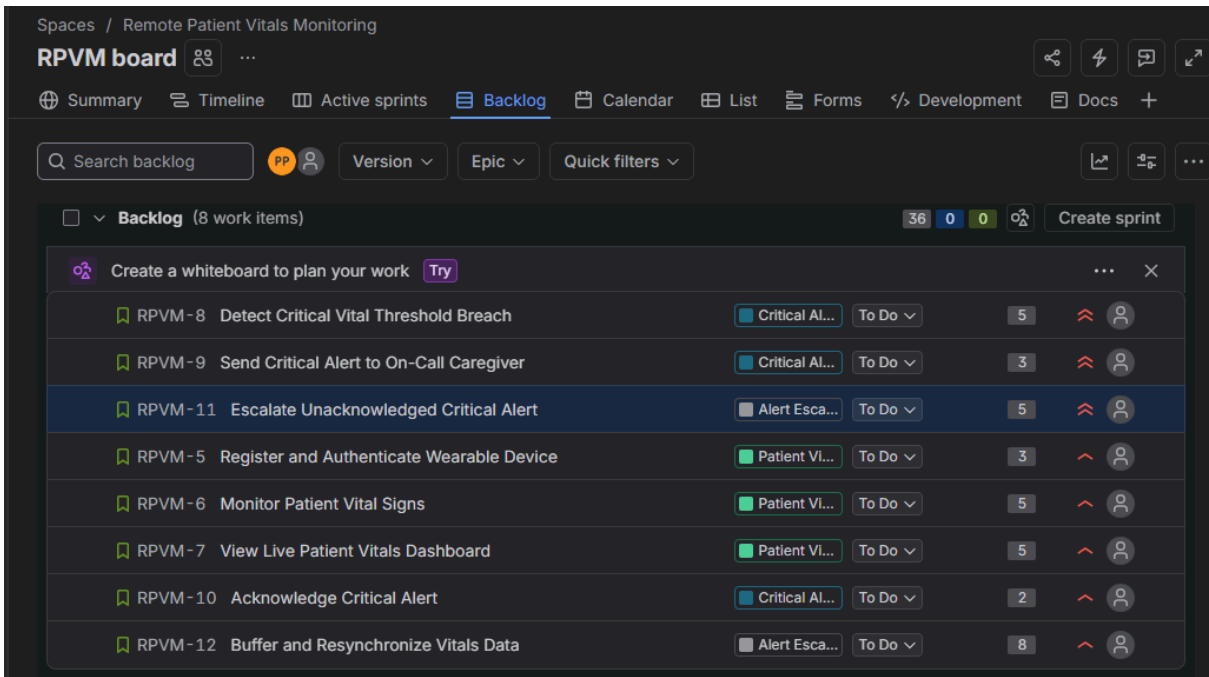

4. What insights did the burndown chart give about team capacity?

The burndown chart showed the reduction in remaining story points as work was completed. It provided a visual representation of sprint progress and showed that the planned Sprint 1 work was completed. The chart also helped demonstrate the relationship between the team's planned workload and its ability to complete the work during the sprint.
